Foreword

1 This is version 2.03.1 of the Linux Standard Base Core Specification for PPC32. An
2 ~~implementation~~This specification is part of ~~this version~~a family of specifications under
3 the ~~specification may not claim to be an implementation of~~the general title "Linux
4 Standard Base~~unless it has successfully completed the compliance process as defined by~~.
5 Developers of applications or implementations interested in using the LSB
6 trademark should see the Free Standards Group [Certification Policy](#) for details.

Introduction

1 The LSB defines a binary interface for application programs that are compiled and
2 packaged for LSB-conforming implementations on many different hardware
3 architectures. Since a binary specification shall include information specific to the
4 computer processor architecture for which it is intended, it is not possible for a
5 single document to specify the interface for all possible LSB-conforming
6 implementations. Therefore, the LSB is a family of specifications, rather than a single
7 one.

8 This document should be used in conjunction with the documents it references. This
9 document enumerates the system components it includes, but descriptions of those
10 components may be included entirely or partly in this document, partly in other
11 documents, or entirely in other reference documents. For example, the section that
12 describes system service routines includes a list of the system routines supported in
13 this interface, formal declarations of the data structures they use that are visible to
14 applications, and a pointer to the underlying referenced specification for
15 information about the syntax and semantics of each call. Only those routines not
16 described in standards referenced by this document, or extensions to those
17 standards, are described in the detail. Information referenced in this way is as much
18 a part of this document as is the information explicitly included here.

19 The specification carries a version number of either the form $x.y$ or $x.y.z$. This
20 version number carries the following meaning:

- 21 • The first number (x) is the major version number. All versions with the same
22 major version number should share binary compatibility. Any addition or
23 deletion of a new library results in a new version number. Interfaces marked as
24 deprecated may be removed from the specification at a major version change.
- 25 • The second number (y) is the minor version number. Individual interfaces may be
26 added if all certified implementations already had that (previously
27 undocumented) interface. Interfaces may be marked as deprecated at a minor
28 version change. Other minor changes may be permitted at the discretion of the
29 LSB workgroup.
- 30 • The third number (z), if present, is the editorial level. Only editorial changes
31 should be included in such versions.

32 Since this specification is a descriptive Application Binary Interface, and not a source
33 level API specification, it is not possible to make a guarantee of 100% backward
34 compatibility between major releases. However, it is the intent that those parts of the
35 binary interface that are visible in the source level API will remain backward
36 compatible from version to version, except where a feature marked as "Deprecated"
37 in one release may be removed from a future release.

38 Implementors are strongly encouraged to make use of symbol versioning to permit
39 simultaneous support of applications conforming to different releases of this
40 specification.

I Introductory Elements

I. Introductory Elements

Chapter 1. Scope

1.1. General

1 The Linux Standard Base (LSB) defines a system interface for compiled applications
2 and a minimal environment for support of installation scripts. Its purpose is to
3 enable a uniform industry standard environment for high-volume applications
4 conforming to the LSB.

5 These specifications are composed of two basic parts: A common specification
6 ("LSB-generic" or "generic LSB") describing those parts of the interface that remain
7 constant across all implementations of the LSB, and an architecture-specific
8 specification supplement ("LSB-arch" or "archLSB") describing the parts of the
9 interface that vary by processor architecture. Together, the LSB-generic and the
10 architecture-specific supplement for a single hardware architecture provide a
11 complete interface specification for compiled application programs on systems that
12 share a common hardware architecture.

13 The LSB-generic document shall be used in conjunction with an architecture-specific
14 supplement. Whenever a section of the LSB-generic specification shall be
15 supplemented by architecture-specific information, the LSB-generic document
16 includes a reference to the architecture supplement. Architecture supplements may
17 also contain additional information that is not referenced in the LSB-generic
18 document.

19 The LSB contains both a set of Application Program Interfaces (APIs) and
20 Application Binary Interfaces (ABIs). APIs may appear in the source code of portable
21 applications, while the compiled binary of that application may use the larger set of
22 ABIs. A conforming implementation shall provide all of the ABIs listed here. The
23 compilation system may replace (e.g. by macro definition) certain APIs with calls to
24 one or more of the underlying binary interfaces, and may insert calls to binary
25 interfaces as needed.

26 The LSB is primarily a binary interface definition. Not all of the source level APIs
27 available to applications may be contained in this specification.

1.2. Module Specific Scope

28 This is the PPC32 architecture specific Core module of the Linux Standards Base
29 (LSB). This module supplements the generic LSB Core module with those interfaces
30 that differ between architectures.

31 Interfaces described in this module are mandatory except where explicitly listed
32 otherwise. Core interfaces may be supplemented by other modules; all modules are
33 built upon the core.

Chapter 2. Normative References

The specifications listed below are referenced in whole or in part by the Linux Standard Base. In this specification, where only a particular section of one of these references is identified, then the normative reference is to that section alone, and the rest of the referenced document is informative.

Table 2-1. Normative References

2 References

2.1 Normative References

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

Note: Where copies of a document are available on the World Wide Web, a Uniform Resource Locator (URL) is given for informative purposes only. This may point to a more recent copy of the referenced specification, or may be out of date. Reference copies of specifications at the revision level indicated may be found at the Free Standards Group's Reference Specifications (<http://refspecs.freestandards.org>) site.

Chapter 3. Requirements

3.1. Relevant Libraries

The libraries listed in Table 3-1 shall be available on PPC32 Linux Standard Base systems, with the specified runtime names. These names override or supplement the names specified in the generic LSB specification. The specified program interpreter, referred to as proginterp in this table, shall be used to load the shared libraries specified by DT_NEEDED entries at run time.

Table 3-1. Standard Library Names

Library	Runtime Name
libm	libm.so.6
libc	libc.so.6
proginterp	/lib/ld-lsb-ppc32.so.2
libpthread	libpthread.so.0
libdl	libdl.so.2
libcrypt	libcrypt.so.1
libgcc_s	libgcc_s.so.1
libz	libz.so.1
libncurses	libncurses.so.5
libutil	libutil.so.1
libc	libc.so.6
libpthread	libpthread.so.0
proginterp	/lib/ld-lsb-ppc32.so.3
libgcc_s	libgcc_s.so.1

These libraries will be in an implementation-defined directory which the dynamic linker shall search by default.

3.2. LSB Implementation Conformance

A conforming implementation is necessarily architecture specific, and must provide the interfaces specified by both the generic LSB Core specification and its relevant architecture specific supplement.

Rationale: An implementation must provide *at least* the interfaces specified in these specifications. It may also provide additional interfaces.

A conforming implementation shall satisfy the following requirements:

- The implementation shall implement fully the architecture described in the hardware manual for the target processor architecture.

- 18 • A processor architecture represents a family of related processors which may not
19 have identical feature sets. The architecture specific supplement to this
20 specification for a given target processor architecture describes a minimum
21 acceptable processor. The implementation shall provide all features of this
22 processor, whether in hardware or through emulation transparent to the
23 application.
- 24 • The implementation shall be capable of executing compiled applications having
25 the format and using the system interfaces described in this document.
- 26 • The implementation shall provide libraries containing the interfaces specified by
27 this document, and shall provide a dynamic linking mechanism that allows these
28 interfaces to be attached to applications at runtime. All the interfaces shall behave
29 as specified in this document.
- 30 • The map of virtual memory provided by the implementation shall conform to the
31 requirements of this document.
- 32 • The implementation's low-level behavior with respect to function call linkage,
33 system traps, signals, and other such activities shall conform to the formats
34 described in this document.
- 35 • The implementation shall provide all of the mandatory interfaces in their entirety.
- 36 • The implementation may provide one or more of the optional interfaces. Each
37 optional interface that is provided shall be provided in its entirety. The product
38 documentation shall state which optional interfaces are provided.
- 39 • The implementation shall provide all files and utilities specified as part of this
40 document in the format defined here and in other referenced documents. All
41 commands and utilities shall behave as required by this document. The
42 implementation shall also provide all mandatory components of an application's
43 runtime environment that are included or referenced in this document.
- 44 • The implementation, when provided with standard data formats and values at a
45 named interface, shall provide the behavior defined for those values and data
46 formats at that interface. However, a conforming implementation may consist of
47 components which are separately packaged and/or sold. For example, a vendor of
48 a conforming implementation might sell the hardware, operating system, and
49 windowing system as separately packaged items.
- 50 • The implementation may provide additional interfaces with different names. It
51 may also provide additional behavior corresponding to data values outside the
52 standard ranges, for standard named interfaces.

3.3.2 LSB Application Conformance

A conforming application is necessarily architecture specific, and must conform to both the generic LSB Core specification and its relevant architecture specific supplement.

A conforming application shall satisfy the following requirements:

- 56 • Its executable files ~~are shall~~ be either shell scripts or object files in the format
57 defined for the Object File Format system interface.
- 58 • Its object files ~~shall~~ participate in dynamic linking as defined in the Program
59 Loading and Linking System interface.

- 61 • It ~~employ~~shall employ only the instructions, traps, and other low-level facilities
62 defined in the Low-Level System interface as being for use by applications.
- 63 • If it requires any optional interface defined in this document in order to be
64 installed or to execute successfully, the requirement for that optional interface
65 ~~is~~shall be stated in the application's documentation.
- 66 • It ~~does~~shall not use any interface or data format that is not required to be provided
67 by a conforming implementation, unless:
- 68 • If such an interface or data format is supplied by another application through
69 direct invocation of that application during execution, that application ~~is~~shall be in
70 turn an LSB conforming application.
- 71 • The use of that interface or data format, as well as its source, ~~is~~shall be identified
72 in the documentation of the application.
- 73 • It shall not use any values for a named interface that are reserved for vendor
74 extensions.

75 A strictly conforming application ~~does~~shall not require or use any interface, facility,
76 or implementation-defined extension that is not defined in this document in order to
77 be installed or to execute successfully.

Chapter 4. Definitions

1 For the purposes of this document, the following definitions, as specified in the
2 *ISO/IEC Directives, Part 2, 2001, 4th Edition*, apply:

3 can

4 be able to; there is a possibility of; it is possible to

5 cannot

6 be unable to; there is no possibility of; it is not possible to

7 may

8 is permitted; is allowed; is permissible

9 need not

10 it is not required that; no...is required

11 shall

12 is to; is required to; it is required that; has to; only...is permitted; it is necessary

13 shall not

14 is not allowed [permitted] [acceptable] [permissible]; is required to be not; is
15 required that...be not; is not to be

16 should

17 it is recommended that; ought to

18 should not

19 it is not recommended that; ought not to

Chapter 5. Terminology

1 For the purposes of this document, the following terms apply:

2 **archLSB**

3 The architectural part of the LSB Specification which describes the specific parts
4 of the interface that are platform specific. The archLSB is complementary to the
5 gLSB.

6 **Binary Standard**

7 The total set of interfaces that are available to be used in the compiled binary
8 code of a conforming application.

9 **gLSB**

10 The common part of the LSB Specification that describes those parts of the
11 interface that remain constant across all hardware implementations of the LSB.

12 **implementation-defined**

13 Describes a value or behavior that is not defined by this document but is
14 selected by an implementor. The value or behavior may vary among
15 implementations that conform to this document. An application should not rely
16 on the existence of the value or behavior. An application that relies on such a
17 value or behavior cannot be assured to be portable across conforming
18 implementations. The implementor shall document such a value or behavior so
19 that it can be used correctly by an application.

20 **Shell Script**

21 A file that is read by an interpreter (e.g., awk). The first line of the shell script
22 includes a reference to its interpreter binary.

23 **Source Standard**

24 The set of interfaces that are available to be used in the source code of a
25 conforming application.

26 **undefined**

27 Describes the nature of a value or behavior not defined by this document which
28 results from use of an invalid program construct or invalid data input. The
29 value or behavior may vary among implementations that conform to this
30 document. An application should not rely on the existence or validity of the
31 value or behavior. An application that relies on any particular value or behavior
32 cannot be assured to be portable across conforming implementations.

33 **unspecified**

34 Describes the nature of a value or behavior not specified by this document
35 which results from use of a valid program construct or valid data input. The
36 value or behavior may vary among implementations that conform to this
37 document. An application should not rely on the existence or validity of the
38 value or behavior. An application that relies on any particular value or behavior
39 cannot be assured to be portable across conforming implementations.

40
41

Other terms and definitions used in this document shall have the same meaning as defined in Chapter 3 of the Base Definitions volume of ISO POSIX (2003).

Chapter 6. Documentation Conventions

1 Throughout this document, the following typographic conventions are used:

2 `function()`
3 the name of a function

4 **command**
5 the name of a command or utility

6 CONSTANT
7 a constant value

8 *parameter*
9 a parameter

10 variable
11 a variable

12 Throughout this specification, several tables of interfaces are presented. Each entry
13 in these tables has the following format:

14 name
15 the name of the interface

16 (symver)
17 An optional symbol version identifier, if required.

18 [refno]
19 A reference number indexing the table of referenced specifications that follows
20 this table.

21 For example,

22 `forkpty(GLIBC_2.0) [HISUSv3]`

23 refers to the interface named `forkpty()` with symbol version `GLIBC_2.0` that is
24 defined in the `firstofSUSv3` reference.

25 **Note:** Symbol versions are defined in the `listed references below the table` architecture
26 specific supplements only.

ELF Specification

ELF Specification

II Executable And Linking Format (ELF)

7 Introduction

1 Executable and Linking Format (ELF) defines the object format for compiled
2 applications. This specification supplements the information found in System V ABI
3 Update and System V Application Binary Interface PowerPC Processor Supplement,
4 and is intended to document additions made since the publication of that document.

~~I. Low Level System Information~~

Chapter 1. Machine Interface

1.1. Processor Architecture

8 Low Level System Information

8.1 Machine Interface

8.1.1 Processor Architecture

The PowerPC Architecture is specified by the following documents:

- System V Application Binary Interface PowerPC Processor Supplement
- The PowerPC™ ~~Architecture~~ Microprocessor Family
- ~~The PowerPC™ Architecture Book I Changes~~
- ~~The PowerPC™ Architecture Book II Changes~~
 - ~~The PowerPC™ Architecture Book III Changes~~

Only the features of the PowerPC 603 processor instruction set may be assumed to be present. An application ~~is responsible for determining~~ should determine if any additional instruction set features are available before using those additional features. If a feature is not present, then the application may not use it.

~~Only instructions which do not require elevated privileges~~ **Note:** The presence of a hardware floating point unit is optional. However, applications requiring floating point arithmetic may ~~be used~~.

~~Applications may not make~~ experience substantial performance penalties on system ~~calls~~ without such a unit.

Conforming applications may use only instructions which do not require elevated privileges.

Conforming applications shall not invoke the implementations underlying system call interface directly. The interfaces in the ~~C library~~ must implementation base libraries shall be used instead.

Rationale: Implementation-supplied base libraries may use the system call interface but applications must not assume any particular operating system or kernel version is present.

An implementation must support the 32-bit computation mode as described in The PowerPC™ ~~Architecture~~ Microprocessor Family. Conforming applications shall not use instructions provided only for the 64-bit mode.

Applications conforming to this specification must provide feedback to the user if a feature that is required for correct execution of the application is not present. Applications conforming to this specification should attempt to execute in a diminished capacity if a required feature is not present.

This specification does not provide any performance guarantees of a conforming system. A system conforming to this specification may be implemented in either hardware or software.

8.1.2. Data Representation

LSB-conforming applications shall use the data representation as defined in Chapter 3 "Data Representation" section of the System V Application Binary Interface PowerPC Processor Supplement.

8.1.2.1. Byte Ordering

LSB-conforming applications shall use big-endian byte ordering. LSB-conforming implementations may support little-endian applications.

8.1.2.2. Fundamental Types

In addition to the fundamental types specified in Chapter 3 "Fundamental Types" section of the System V Application Binary Interface PowerPC Processor Supplement, a 64 bit data type is defined here.

Table 8-1-4. Scalar Types

Type	C	sizeof	Alignment (bytes)	Intel386 Architecture
Integral	long long	8	8	signed double word
	signed long long			
	unsigned long long	8	8	unsigned double word

LSB-conforming applications shall not use the long double fundamental type.

18.2.3. Aggregates and Unions

1.2.4. Bit Fields

Chapter 2. Function Calling Sequence

LSB-conforming applications shall use the function calling sequence as defined in Chapter 3, Section "Function Calling Sequence" of the System V Application Binary Interface PowerPC Processor Supplement.

8.2.1. CPU Registers

See LSB-conforming applications shall use only the registers described in Chapter 3, Section "Function Calling Sequence", Subsection "Registers" of the System V Application Binary Interface PowerPC Processor Supplement.

8.2.2. Floating Point Registers

See LSB-conforming applications shall use only the registers described in Chapter 3, Section "Function Calling Sequence", Subsection "Registers" of the System V Application Binary Interface PowerPC Processor Supplement.

8.2.3. Stack Frame

See LSB-conforming applications shall use stack frames as described in Chapter 3, Section "Function Calling Sequence", Subsection "The Stack Frame" of the System V Application Binary Interface PowerPC Processor Supplement.

8.2.4. Arguments

See LSB-conforming applications shall pass parameters to functions as described in Chapter 3, Section "Function Calling Sequence", Subsection "Parameter Passing" of the System V Application Binary Interface PowerPC Processor Supplement.

8.2.5. Return Values

LSB-conforming applications shall not return structures or unions in registers as described in Chapter 3, Section 3 "Function Calling Sequence", Subsection "Return Values" of System V Application Binary Interface PowerPC Processor Supplement. Instead they must use the alternative method of passing the address of a buffer in a register as shown in the same section.

Chapter 8.3. Operating System Interface

LSB-conforming applications shall use the Operating System Interfaces as defined in Chapter 3, Section "Operating System Interface" of the System V Application Binary Interface PowerPC Processor Supplement.

8.3.1. Processor Execution Mode Exception Interface

See LSB-conforming applications shall use the Exception Interfaces as defined in Chapter 3, Section "Exception Interface" of the System V Application Binary Interface PowerPC Processor Supplement.

8.3.2. Exception Interface

See The LSB does not specify debugging information, however, if the DWARF specification is implemented, see Chapter 3, Section "DWARF Definition" of the System V Application Binary Interface PowerPC Processor Supplement.

8.3.2.1. Hardware Exception Types Signal Delivery

See LSB-conforming applications shall follow the guidelines defined in Chapter 3, Section "Exception Interface" of the System V Application Binary Interface PowerPC Processor Supplement.

3.2.2. Software Trap Types

See LSB-conforming applications shall use the Process initialization as defined in Chapter 3, Section "Process Initialization" of the System V Application Binary Interface PowerPC Processor Supplement.

3.2.3. Debugging Support

See Chapter 3 of the .

8.4.1 Special Registers

Contrary to what is stated in the Registers part of chapter 3 of the System V Application Binary Interface PowerPC Processor Supplement:

3.2.4. Process Startup

See Chapter 3 of the there are no values set in registers r3, r4, r5, r6 and r7. Instead the values specified to appear in all of those registers except r7 are placed on the stack. The value to be placed into register r7, the termination function pointer is not passed to the process.

8.4.2 Process Stack (on entry)

Figure 3-31 in System V Application Binary Interface PowerPC Processor Supplement.

3.3. Signal Delivery

3.3.1. Signal Handler Interface

~~See Chapter 3 of the System V Application Binary Interface PowerPC Processor Supplement.~~

~~Chapter 4. Process Initialization~~

~~LSB-conforming applications shall use the Operating System Interfaces as defined in Chapter 3 of the~~ is incorrect. The initial stack must look like the following.

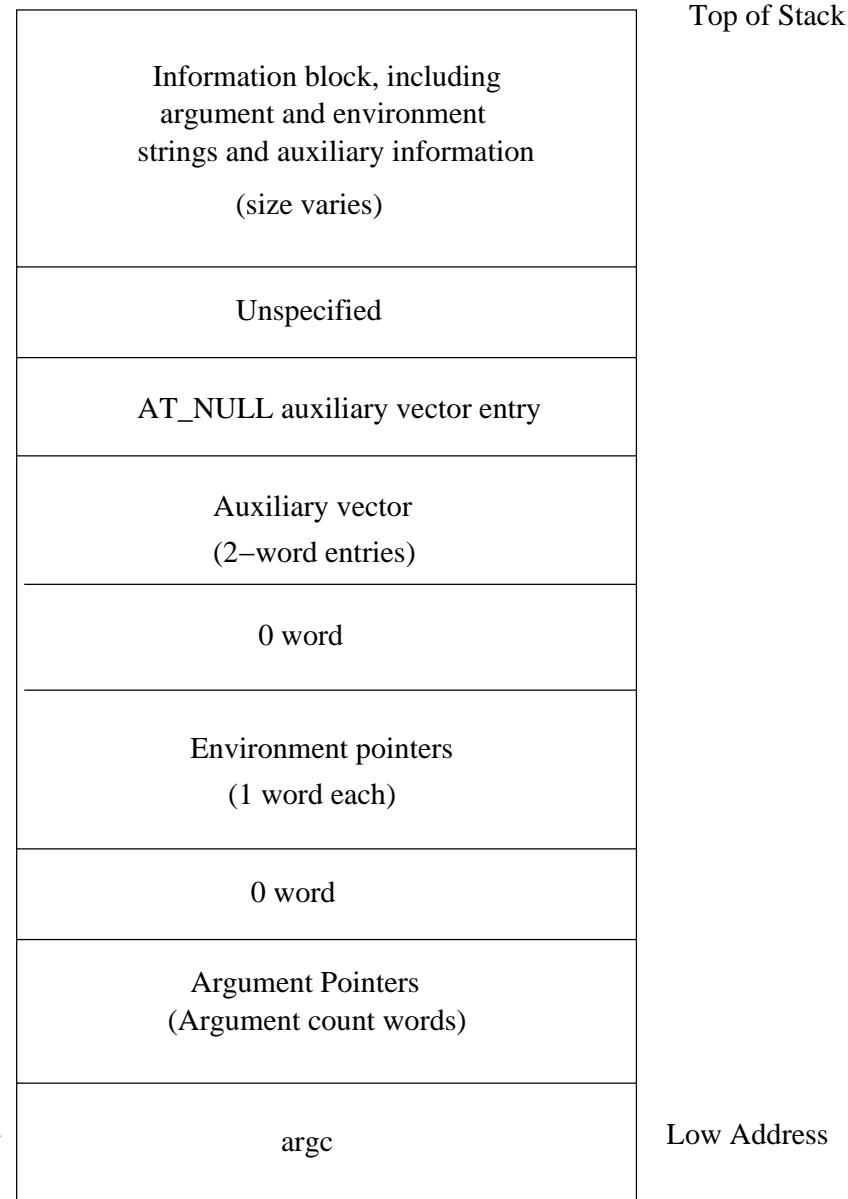

Figure 8-1 Initial Process Stack

8.4.3 Auxiliary Vector

In addition to the types defined in Chapter 3, Section "Process Initialization", Subsection "Process Stack" of the System V Application Binary Interface PowerPC Processor Supplement.

4.1. Special Registers

Contrary to what is stated in the Registers part of Chapter 3 of the System V Application Binary Interface PowerPC Processor Supplement there are no values set in registers r3, r4, r5, r6 and r7. Instead the values specified to appear in all of those registers except r7 are placed on the stack. The value to be placed into register r7, the termination function pointer is not passed to the process.

4.2. Process Stack (on entry)

~~Figure 3-31 in System V Application Binary Interface PowerPC Processor Supplement is incorrect. The initial stack must look like the following.~~

~~Figure 4-1. Initial Process Stack~~

4.3. Auxiliary Vector

~~In addition to the types defined in Chapter 3 of the System V Application Binary Interface PowerPC Processor Supplement the following are also supported:~~

~~Table 4-1. Extra Auxiliary Types~~

~~the following are also supported:~~

Table 8-2 Extra Auxiliary Types

Name	Value	Comment
AT_NOTELF	10	Program is not ELF
AT_UID	11	Real uid
AT_EUID	12	Effective uid
AT_GID	13	Real gid
AT_EGID	14	Effective gid
AT_PLATFORM	15	String identifying CPU for optimizations
AT_HWCAP	16	Arch dependent hints at CPU capabilities
AT_CLKTCK	17	Frequency at which times() increments
AT_DCACHEBSIZE	19	The a_val member of this entry gives the data cache block size for processors on the system on which this program is

Name	Value	Comment
		running. If the processors have unified caches, AT_DCACHEBSIZE is the same as AT_UCACHEBSIZE
AT_ICACHEBSIZE	20	The a_val member of this entry gives the instruction cache block size for processors on the system on which this program is running. If the processors have unified caches, AT_DCACHEBSIZE is the same as AT_UCACHEBSIZE.
AT_UCACHEBSIZE	21	The a_val member of this entry is zero if the processors on the system on which this program is running do not have a unified instruction and data cache. Otherwise it gives the cache block size.
AT_IGNOREPPC	22	All entries of this type should be ignored.

The last three entries in the table above override the values specified in System V Application Binary Interface PowerPC Processor Supplement.

4.4. Environment

Chapter 8.5. Coding Examples

LSB-conforming applications may ~~implement fundamental operations using~~ use the coding examples given in Chapter 3, Section "Coding Examples" ~~as defined in Chapter 3~~ of the System V Application Binary Interface PowerPC Processor Supplement.

to guide implementation of fundamental operations in the following areas.

8.5.1. Code Model Overview/Architecture Constraints

See LSB-Conforming applications may use any of the code models described in Chapter 3, Section "Coding Examples", Subsection "Code Model Overview" of the System V Application Binary Interface PowerPC Processor Supplement.

8.5.2. Position-Independent Function Prologue

See LSB-Conforming applications may use examples described in Chapter 3, Section "Coding Examples", Subsection "Function Prologue and Epilogue" of the System V Application Binary Interface PowerPC Processor Supplement.

8.5.3. Data Objects

5.3.1. Absolute Load & Store

See LSB-Conforming applications may use examples described in Chapter 3, Section "Coding Examples", Subsection "Data Objects" of the System V Application Binary Interface PowerPC Processor Supplement.

5.3.2. Position Relative Load & Store

See Chapter 3 of the .

8.5.4 Function Calls

LSB-Conforming applications may use examples described in Chapter 3, Section "Coding Examples", Subsection "Function Calls" of the System V Application Binary Interface PowerPC Processor Supplement.

8.5.4. Function Calls5 Branching

See LSB-Conforming applications may use examples described in Chapter 3, Section "Coding Examples", Subsection "Branching" of the System V Application Binary Interface PowerPC Processor Supplement.

5.4.1. Absolute Direct Function Call

See Chapter 3 of the .

8.6 C Stack Frame

8.6.1 Variable Argument List

LSB-Conforming applications shall only use variable arguments to functions in the manner described in Chapter 3, Section "Function Calling Sequence", Subsection "Variable Argument Lists" of the System V Application Binary Interface PowerPC Processor Supplement.

5.4.2. Absolute Indirect Function Call

See Chapter 3 of the .

8.6.2 Dynamic Allocation of Stack Space

LSB-Conforming applications shall follow guidelines discussed in in Chapter 3, Section "Coding Examples", Subsection "Dynamic Stack Space Allocation" of the System V Application Binary Interface PowerPC Processor Supplement.

5.4.3. Position-Independent Direct Function Call

See Chapter 3 of the System V Application Binary Interface PowerPC Processor Supplement.

5.4.4. Position-Independent Indirect Function Call

See Chapter 3 of the System V Application Binary Interface PowerPC Processor Supplement.

5.5. Branching

See Chapter 3 of the System V Application Binary Interface PowerPC Processor Supplement.

5.5.1. Branch Instruction

See Chapter 3 of the System V Application Binary Interface PowerPC Processor Supplement.

5.5.2. Absolute switch() code

See Chapter 3 of the System V Application Binary Interface PowerPC Processor Supplement.

5.5.3. Position-Independent switch() code

See Chapter 3 of the System V Application Binary Interface PowerPC Processor Supplement.

~~Chapter 6. C Stack Frame~~

~~6.1. Variable Argument List~~

~~See Chapter 3 of the System V Application Binary Interface PowerPC Processor Supplement.~~

~~6.2. Dynamic Allocation of Stack Space~~

~~See Chapter 3 of the System V Application Binary Interface PowerPC Processor Supplement.~~

Chapter 8.7: Debug Information

1 The LSB does not currently specify the format of Debug information.

H.9 Object Format

9.1 Introduction

LSB-conforming implementations shall support an object file , called Executable and Linking Format (ELF) as defined by the System V Application Binary Interface PowerPC Processor Supplement and as supplemented by the Linux Standard Base Specification and this document. LSB-conforming implementations need not support tags related functionality. LSB-conforming applications must not rely on tags related functionality.

Chapter 8.9.2 ELF Header

89.2.1. Machine Information

LSB-conforming applications shall use the Machine Information as defined in System V Application Binary Interface PowerPC Processor Supplement, Chapter 4, [Section "ELF Header"](#) Subsection "Machine Information".

8.19.3 Sections

9.3.1. File Class

8.1.2. Data Encoding

8.1.3. OS Identification

8.1.4. Processor Identification

See Chapter 4 of the System V Application Binary Interface PowerPC Processor Supplement.

8.1.5. Processor Specific Flags

See Chapter 4 of the System V Application Binary Interface PowerPC Processor Supplement.

Chapter 9. Sections

9.1. Special Sections

The following sections are defined in the System V Application Binary Interface PowerPC Processor Supplement, Chapter 4, Section "Section", Subsection "Special Sections".

Table 9-1. ELF Special Sections

Name	Type	Attributes
.got	SHT_PROGBITS	SHF_ALLOC+SHF_WRITE+SHF_EXECINSTR
.plt	SHT_NOBITS	SHF_ALLOC+SHF_WRITE+SHF_EXECINSTR
.sdata	SHT_PROGBITS	SHF_ALLOC+SHF_WRITE

.got

This section holds the global offset table. See 'Coding Examples' in Chapter 3, 'Special Sections' in Chapter 4, and 'Global Offset Table' in Chapter 5 of the processor supplement for more information.

.plt

This section holds the Procedure Linkage Table

.sdata

This section holds initialized small data that contribute to the program memory image

Note that the .tags, .taglist and .tagsym sections described in Chapter 4, Section "Sections" of the System V Application Binary Interface PowerPC Processor Supplement are not supported.

9.3.2. Linux Special Sections

The following Linux PPC32 specific sections are defined here.

Table 9-2. Additional Special Sections

Name	Type	Attributes
.got2	SHT_PROGBITS	SHF_ALLOC+SHF_WRITE
.rela.bss	SHT_RELAT	SHF_ALLOC
.rela.dyn	SHT_RELAT	SHF_ALLOC
.rela.got	SHT_RELAT	SHF_ALLOC
.rela.got2	SHT_RELAT	SHF_ALLOC

Name	Type	Attributes
.rela.plt	SHT_RELAT	SHF_ALLOC
.rela.sbss	SHT_RELAT	SHF_ALLOC
.sbss	SHT_NOBITS	SHF_ALLOC+SHF_WRI TE
.sdata2	SHT_PROGBITS	SHF_ALLOC

.got2

This section holds the second level GOT

.rela.bss

This section holds RELA type relocation information for the BSS section of a shared library or dynamically linked application

.rela.dyn

This section holds RELA type relocation information for all sections of a shared library except the PLT

.rela.got

This section holds RELA type relocation information for the GOT section of a shared library or dynamically linked application

.rela.got2

This section holds RELA type relocation information for the second level GOT section of a shared library or dynamically linked application

.rela.plt

This section holds RELA type relocation information for the PLT section of a shared library or dynamically linked application

.rela.sbss

This section holds RELA type relocation information for the SBSS section of a shared library or dynamically linked application

.sbss

This section holds uninitialized data that contribute to the program's memory image. The system initializes the data with zeroes when the program begins to run.

.sdata2

This section holds the second level of initialised small data

9.3.4 Symbol Table

LSB-conforming applications shall use the Symbol Table as defined in Chapter 4, Section **Types**

See Chapter 4 "Symbol Table" of the System V Application Binary Interface PowerPC Processor Supplement.

9.5 Relocation

LSB-conforming applications shall use Relocations as defined in Chapter 4, Section **Attribute**

Flags

See Chapter 4 "Relocation" of the System V Application Binary Interface PowerPC Processor Supplement.

9.5. Special Section Types

See Chapter 4 of the .

9.5.1 Relocation Types

LSB-conforming applications shall support the relocation types as defined in the Chapter 4, Section "Relocation" Subsection "Relocation Types" except for the relocation type R_PPC_ADDR30 as specified in Table 4-8 of System V Application Binary Interface PowerPC Processor Supplement.

Chapter 10. Symbol Table

1

LSB conforming applications shall use the Symbol Table as defined in Chapter 4 of the.

10 Program Loading and Dynamic Linking

10.1 Introduction

LSB-conforming implementations shall support the object file information and system actions that create running programs as specified in the System V ~~Application Binary Interface PowerPC Processor Supplement ABI~~.

Chapter 11. Relocation

~~LSB-conforming applications shall use Relocations as defined in Chapter 4 of the~~, System V Application Binary Interface PowerPC Processor Supplement.

11.1. Relocation Types

~~The relocation type R_PPC_ADDR30 as specified in Table 4-8 of Chapter 5 and as supplemented by the generic Linux Standard Base Specification and this document.~~

10.2 Program Header

~~LSB-conforming applications shall support the program header as defined in the System V Application Binary Interface PowerPC Processor Supplement~~
~~is not supported.~~

~~III. Program Loading and Dynamic Linking~~

~~LSB-conforming implementations shall support the object file information and system actions that create running programs as specified in the Chapter 5, Section "Program Loading".~~

10.3 Program Loading

LSB-conforming implementations shall map file pages to virtual memory pages as described in Section "Program Loading" of the System V ~~ABI~~ Application Binary Interface PowerPC Processor Supplement, Chapter 5.

10.4 Dynamic Linking

LSB-conforming implementations shall provide dynamic linking as specified in Section "Dynamic Linking" of the System V Application Binary Interface PowerPC Processor Supplement ~~and as supplemented by the generic Linux Standard Base Specification and this document.~~

~~Chapter 12. Program Header~~

~~12.1. Types~~

~~12.2. Flags~~

~~Chapter 13. Program Loading~~

~~See, Chapter 5.~~

10.4.1 Dynamic Section

The following dynamic entries are defined in the System V Application Binary Interface PowerPC Processor Supplement, Chapter 5.~~4~~

Chapter 14.

Section "Dynamic Linking"

See System V Application Binary Interface PowerPC Processor Supplement, Chapter 5.4.

14.1. Program Interpreter/Dynamic Linker

The LSB specifies the Program Interpreter to be /lib/ld.lsb.ppe32.so.2.

14.2. Dynamic Section

The following dynamic entries are defined in the System V Application Binary Interface PowerPC Processor Supplement, Chapter 5.4 .

DT_JMPREL

This entry is associated with a table of relocation entries for the procedure linkage table.

This entry is mandatory both for executable and shared object files

DT_PLTGOT

This entry's d_ptr member gives the address of the first byte in the procedure linkage table

In addition the following dynamic entries are also supported:

DT_RELACOUNT

The number of relative relocations in .rela.dyn

14.3.10.4.2 Global Offset Table

See LSB-conforming implementations shall support a Global Offset Table as described in Chapter 5, Section "Dynamic Linking" of the System V Application Binary Interface PowerPC Processor Supplement, Chapter 5.4.

14.4. Shared Object Dependencies

See Chapter 5 of the .

10.4.3 Function Addresses

Function addresses shall behave as described in Chapter 5, Section "Dynamic Linking", Subsection "Function Addresses" of the System V Application Binary Interface PowerPC Processor Supplement.

14.5. Function Addresses

See LSB-conforming implementations shall support a Procedure Linkage Table as described in Chapter 5, Section "Dynamic Linking", Subsection "Procedure Linkage Table" of the System V Application Binary Interface PowerPC Processor Supplement.

14.6. Procedure Linkage Table

~~See Chapter 5 of the System V Application Binary Interface PowerPC Processor Supplement.~~

14.7. Initialization and Termination Functions

I. Base Libraries

Chapter 1.

11 Libraries

An LSB-conforming implementation shall support base libraries which provide interfaces for accessing the operating system, processor and other hardware in the system.

Only those interfaces that are unique to the PowerPC 32 platform are defined here. This section should be used in conjunction with the corresponding section in the generic Linux Standard Base Core Specification.

1.1.1 Program Interpreter/Dynamic Linker

The LSB specifies the Program Interpreter to shall be /lib/ld-1sb-ppc32.so.²³.

11.2 Interfaces for libc

Table 11-1 defines the library name and shared object name for the libc library

Table 11-1 libc Definition

Library:	libc
SONAME:	libc.so.6

The behavior of the interfaces in this library is specified by the following specifications:

[LFS] Large File Support

[LSB] this specification

[SUSv2] SUSv2

[SUSv3] ISO POSIX (2003)

[SVID.3] SVID Issue 3

[SVID.4] SVID Issue 4

11.2.1 RPC

11.2.1.1 Interfaces for RPC

An LSB conforming implementation shall provide the architecture specific functions for RPC specified in Table 11-2, with the full mandatory functionality as described in the referenced underlying specification.

Table 11-2 libc - RPC Function Interfaces

authnone_create(GLIBC_2.0) [SVID.4]	clnt_create(GLIBC_2.0) [SVID.4]	clnt_pcreateerror(GLIBC_2.0) [SVID.4]	clnt_perrno(GLIBC_2.0) [SVID.4]

Referenced Specification(s)

11.3 Data Definitions for libc

This section defines global identifiers and their values that are associated with interfaces contained in libc. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ~~this specification~~ ISO C (1999)

~~[2] ISO POSIX (2003)~~

~~An LSB conforming implementation shall provide the architecture specific deprecated functions for Time Manipulation specified in Table 1-20, with the full functionality as described in the reference underlying specification.~~

~~These interfaces are deprecated, and applications should avoid using them. These interfaces may be withdrawn in future releases of this specification.~~

Table 1-20. libc—Time Manipulation Deprecated Function Interfaces

adjtimex(GLIBC_2.0)				
--------------------------------	--	--	--	--

C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

11.3.1 arpa/inet.h

```
extern uint32_t htonl(uint32_t);
extern uint16_t htons(uint16_t);
```

1.3. Data Definitions for libc

This section defines global identifiers and their values that are associated with interfaces contained in libc. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content.

These definitions are intended to supplement those provided in the referenced underlying specifications.

This specification uses ISO/IEC 9899 C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

1.4. Interfaces for libm

Table 1-28 defines the library name and shared object name for the libm library.

Table 1-28. libm Definition

Library:	libm
SONAME:	libm.so.6

The behavior of the interfaces in this library is specified by the following specifications:

ISO C (1999)

SUSv2

ISO POSIX (2003)

```
extern int flock(int, int);
```

11.3.49 sys/ioctl.h

```
#define TIOCGWINSZ      0x40087468
#define TIOCNOTTY       0x5422
#define FIONREAD        1074030207
```

1.4.1. Math

1.4.1.1. Interfaces for Math

An LSB conforming implementation shall provide the architecture specific functions for Math specified in Table 1-29, with the full functionality as described in the referenced underlying specification.

Table 1-29. libm – Math Function Interfaces

Reference Specification(s)

[1] [this specification](#)

1.7. Interface Definitions for libgee_s

The following interfaces are included in libgee_s and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed above for libgee_s shall behave as described in the referenced base document.

_Unwind_DeleteException

Name

_Unwind_DeleteException — private C++ error handling method

Synopsis

```
void _Unwind_DeleteException((struct _Unwind_Exception *object));
```

Description

_Unwind_DeleteException deletes the given exception *object*. If a given runtime resumes normal execution after catching a foreign exception, it will not know how to delete that exception. Such an exception shall be deleted by calling _Unwind_DeleteException. This is a convenience function that calls the function pointed to by the *exception_cleanup* field of the exception header.

_Unwind_Find_FDE

Name

_Unwind_Find_FDE — private C++ error handling method

Synopsis

```
fde * _Unwind_Find_FDE(void *pc, (struct dwarf_eh_bases *bases));
```

Description

_Unwind_Find_FDE looks for the object containing *pc*, then inserts into *bases*.

_Unwind_ForceUnwind

Name

_Unwind_ForceUnwind — private C++ error handling method

Synopsis

```
_Unwind_Reason_Code _Unwind_ForceUnwind((struct _Unwind_Exception *object),  
_Unwind_Stop_Fn stop, void *stop_parameter);
```

Description

_Unwind_ForceUnwind raises an exception for forced unwinding, passing along the given exception **object**, which should have its **exception_class** and **exception_cleanup** fields set. The exception **object** has been allocated by the language specific runtime, and has a language specific format, except that it shall contain an **_Unwind_Exception** struct.

Forced unwinding is a single phase process. **stop** and **stop_parameter** control the termination of the unwind process instead of the usual personality routine query. **stop** is called for each unwind frame, with the parameters described for the usual personality routine below, plus an additional **stop_parameter**.

Return Value

When **stop** identifies the destination frame, it transfers control to the user code as appropriate without returning, normally after calling **_Unwind_DeleteException**. If not, then it should return an **_Unwind_Reason_Code** value. If **stop** returns any reason code other than **_URC_NO_REASON**, then the stack state is indeterminate from the point of view of the caller of **_Unwind_ForceUnwind**. Rather than attempt to return, therefore, the unwind library should use the **exception_cleanup** entry in the exception, and then call **abort**.

_URC_NO_REASON

— This is not the destination frame. The unwind runtime will call frame's personality routine with the **_UA_FORCE_UNWIND** and **_UA_CLEANUP_PHASE** flag set in **actions**, and then unwind to the next frame and call the **stop** function again.

_URC_END_OF_STACK

— In order to allow **_Unwind_ForceUnwind** to perform special processing when it reaches the end of the stack, the unwind runtime will call it after the last frame is rejected, with a **NULL** stack pointer in the context, and the **stop** function shall catch this condition. It may return this code if it cannot handle end-of-stack.

_URC_FATAL_PHASE2_ERROR

— The **stop** function may return this code for other fatal conditions like stack corruption.

_Unwind_GetDataRelBase

Name

`_Unwind_GetDataRelBase` — private IA64 C++ error handling method

Synopsis

```
_Unwind_Ptr _Unwind_GetDataRelBase((struct _Unwind_Context *context));
```

Description

`_Unwind_GetDataRelBase` returns the global pointer in register one for `context`.

_Unwind_GetGR

Name

`_Unwind_GetGR` — private C++ error handling method

Synopsis

```
_Unwind_Word _Unwind_GetGR((struct _Unwind_Context *context), int index);
```

Description

`_Unwind_GetGR` returns data at `index` found in `context`. The register is identified by its index: 0 to 31 are for the fixed registers, and 32 to 127 are for the stacked registers.

During the two phases of unwinding, only GR1 has a guaranteed value, which is the global pointer of the frame referenced by the unwind `context`. If the register has its NAT bit set, the behavior is unspecified.

_Unwind_GetIP

Name

`_Unwind_GetIP` — private C++ error handling method

Synopsis

```
_Unwind_Ptr _Unwind_GetIP((struct _Unwind_Context *context));
```

Description

`_Unwind_GetIP` returns the instruction pointer value for the routine identified by the unwind `context`.

_Unwind_GetLanguageSpecificData

Name

`_Unwind_GetLanguageSpecificData` — private C++ error handling method

Synopsis

```
_Unwind_Ptr _Unwind_GetLanguageSpecificData((struct _Unwind_Context *context), uint value);
```

Description

`_Unwind_GetLanguageSpecificData` returns the address of the language specific data area for the current stack frame.

_Unwind_GetRegionStart

Name

`_Unwind_GetRegionStart` — private C++ error handling method

Synopsis

```
_Unwind_Ptr _Unwind_GetRegionStart((struct _Unwind_Context *context));
```

Description

`_Unwind_GetRegionStart` routine returns the address (i.e., 0) of the beginning of the procedure or code fragment described by the current unwind descriptor block.

_Unwind_GetTextRelBase

Name

`_Unwind_GetTextRelBase` — private IA64 C++ error handling method

Synopsis

```
_Unwind_Ptr _Unwind_GetTextRelBase((struct _Unwind_Context *context));
```

Description

`_Unwind_GetTextRelBase` calls the abort method, then returns.

[_Unwind_RaiseException](#)

Name

[_Unwind_RaiseException](#) — private C++ error handling method

Synopsis

```

#define _Unwind_RaiseException(##define SO_RCVLOWAT      16
#define SO_SNDLOWAT      17
#define SO_RCVTIMEO      18
#define SO_SNDFTIMEO     19

extern int bind(int, const struct sockaddr *, socklen_t);
extern int getnameinfo(const struct sockaddr *, socklen_t, char *,
                      socklen_t, char *, socklen_t, unsigned int);
extern int getsockname(int, struct sockaddr *, socklen_t *);
extern int listen(int, int);
extern int setsockopt(int, int, int, const void *, socklen_t);
extern int accept(int, struct sockaddr *, socklen_t *);
extern int connect(int, const struct sockaddr *, socklen_t);
extern ssize_t recv(int, void *, size_t, int);
extern ssize_t recvfrom(int, void *, size_t, int, struct sockaddr *,
                      socklen_t *);
extern ssize_t recvmsg(int, struct msghdr *, int);
extern ssize_t send(int, const void *, size_t, int);
extern ssize_t sendmsg(int, const struct msghdr *, int);
extern ssize_t sendto(int, const void *, size_t, int,
                     const struct sockaddr *, socklen_t);
extern int getpeername(int, struct sockaddr *, socklen_t *);
extern int getsockopt(int, int, int, void *, socklen_t *);
extern int shutdown(int, int);
extern int socket(int, int, int);
extern int socketpair(int, int, int, int);
extern int socketmark(int);

```

11.3.59 sys/stat.h

```

#define _STAT_VER      3

struct _Unwind_Exception *object))-stat64 {

```

Description

`_Unwind_RaiseException` raises an exception, passing along the given exception object, which should have its `exception_class` and `exception_cleanup` fields set. The exception object has been allocated by the language specific runtime, and has a language specific format, exception that it shall contain an `_Unwind_Exception`.

Return Value

`_Unwind_RaiseException` does not return unless an error condition is found. If an error condition occurs, an `_Unwind_Reason_Code` is returned:

`_URC_END_OF_STACK`

The unwinder encountered the end of the stack during phase one without finding a handler. The unwind runtime will not have modified the stack. The C++ runtime will normally call `uncaught_exception` in this case.

`_URC_FATAL_PHASE1_ERROR`

The unwinder encountered an unexpected error during phase one, because of something like stack corruption. The unwind runtime will not have modified the stack. The C++ runtime will normally call `terminate` in this case.

`_URC_FATAL_PHASE2_ERROR`

The unwinder encountered an unexpected error during phase two. This is usually a `throw`, which will call `terminate`.

`_Unwind_Resume`

Name

`_Unwind_Resume` — private C++ error handling method

Synopsis

```
void _Unwind_Resume((struct _Unwind_Exception *object));
```

Description

`_Unwind_Resume` resumes propagation of an existing exception object. A call to this routine is inserted as the end of a landing pad that performs cleanup, but does not resume normal execution. It causes unwinding to proceed further.

_Unwind_SetGR

Name

`_Unwind_SetGR` — private C++ error handling method

Synopsis

```
void _Unwind_SetGR((struct _Unwind_Context *context), int index, uint value);
```

Description

`_Unwind_SetGR` sets the *value* of the register *index* for the routine identified by the *unwind context*.

_Unwind_SetIP

Name

`_Unwind_SetIP` — private C++ error handling method

Synopsis

```
void _Unwind_SetIP((struct _Unwind_Context *context), uint value);
```

Description

`_Unwind_SetIP` sets the *value* of the instruction pointer for the routine identified by the *unwind context*.

H. Utility Libraries

Chapter 2. Libraries

The Utility libraries are those that are commonly used, but not part of the Single Unix Specification.

2.1. Interfaces for libz

Table 2-1. libz Definition

Library:	<code>libz</code>
SONAME:	<code>libz.so.1</code>

2.1.1. Compression Library

2.1.1.1. Interfaces for Compression Library

2.2. Data Definitions for libz

This section contains standard data definitions that describe system data. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content.

ISO C serves as the LSB reference programming language, and data definitions are specified in ISO C. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

2.3. Interfaces for libncurses

Table 2-2. libncurses Definition

Library:	<code>libncurses</code>
SONAME:	<code>libncurses.so.5</code>

```
2extern ssize_t readv(int, const struct iovec *, int);
extern ssize_t writev(int, const struct iovec *, int);
```

11.3.66 sys/un.h

```
/*
 * This header is architecture neutral
 * Please refer to the generic specification for details
 */
```

11.3.1. Curses67 sys/utsname.h

2

```
extern int uname(struct utsname *);
```

11.3.1.1. Interfaces for Curses

2.4. Data Definitions for libncurses

This section contains standard data definitions that describe system data. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content.

ISO C serves as the LSB reference programming language, and data definitions are specified in ISO C. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

2.4.1. curses68 sys/wait.h

```
extern pid_t wait(int *);
extern pid_t waitpid(pid_t, int *, int);
extern pid_t wait4(pid_t, int *, int, struct rusage *);
```

11.4 Interfaces for libm

Table 11-24 defines the library name and shared object name for the libm library

Table 11-24 libm Definition

Library:	libm
SONAME:	libm.so.6

The behavior of the interfaces in this library is specified by the following specifications:

[ISO99] ISO C (1999)
[LSB] This Specification
[SUSv2] SUSv2
[SUSv3] ISO POSIX (2003)

11.4.1 Math

11.4.1.1 Interfaces for Math

An LSB conforming implementation shall provide the architecture specific functions for Math specified in Table 11-25, with the full mandatory functionality as described in the referenced underlying specification.

Table 11-25 libm - Math Function Interfaces

<code>_finite(GLIBC_2.1) [ISO99]</code>	<code>_finitef(GLIBC_2.1) [ISO99]</code>	<code>_finitel(GLIBC_2.1) [ISO99]</code>	<code>_fpclassify(GLIBC_C_2.1) [LSB]</code>

11.5 Data Definitions for libm

20

This section defines global identifiers and their values that are associated with interfaces contained in libm. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

21

22

23

24

25

26

27

28

29

30

31

32

33

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

11.6 Interfaces for libpthread

Table 11-27 defines the library name and shared object name for the libpthread library

Table 11-27 libpthread Definition

Library:	libpthread
SONAME:	libpthread.so.0

The behavior of the interfaces in this library is specified by the following specifications:

[LFS] Large File Support
 [LSB] This Specification
 [SUSv3] ISO POSIX (2003)

11.6.1 Realtime Threads

11.6.1.1 Interfaces for Realtime Threads

An LSB conforming implementation shall provide the architecture specific functions for Realtime Threads specified in Table 11-28, with the full mandatory functionality as described in the referenced underlying specification.

Table 11-28 libpthread - Realtime Threads Function Interfaces

pthread_attr_getinheritsched(GLIBC_2.0) [SUSv3]	pthread_attr_getschedpolicy(GLIBC_2.0) [SUSv3]	pthread_attr_getscope(GLIBC_2.0) [SUSv3]	pthread_attr_setscheduler(GLIBC_2.0) [SUSv3]
pthread_attr_setschedpolicy(GLIBC_2.0) [SUSv3]	pthread_attr_setscope(GLIBC_2.0) [SUSv3]	pthread_setscheduler(param(GLIBC_2.0)) [SUSv3]	pthread_setschedparam(param(GLIBC_2.0)) [SUSv3]

11.6.2 Advanced Realtime Threads

11.6.2.1 Interfaces for Advanced Realtime Threads

No external functions are defined for libpthread - Advanced Realtime Threads in this part of the specification. See also the generic specification.

11.6.3 Posix Threads

11.6.3.1 Interfaces for Posix Threads

An LSB conforming implementation shall provide the architecture specific functions for Posix Threads specified in Table 11-29, with the full mandatory functionality as described in the referenced underlying specification.

Table 11-29 libpthread - Posix Threads Function Interfaces

11.7 Data Definitions for libpthread

411

412

413

414

This section defines global identifiers and their values that are associated with interfaces contained in libpthread. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an

415 interface is defined as requiring a particular system header file all of the data
 416 definitions for that system header file presented here shall be in effect.
 417 This section gives data definitions to promote binary application portability, not to
 418 repeat source interface definitions available elsewhere. System providers and
 419 application developers should use this ABI to supplement - not to replace - source
 420 interface definition specifications.
 421 This specification uses the ISO C (1999) C Language as the reference programming
 422 language, and data definitions are specified in ISO C format. The C language is used
 423 here as a convenient notation. Using a C language description of these data objects
 424 does not preclude their use by other programming languages.

11.7.1 pthread.h

```
425
426     extern void __pthread_cleanup_pop(struct __pthread_cleanup_buffer *,
427                                         int);
428     extern void __pthread_cleanup_push(struct __pthread_cleanup_buffer *,

11.8 Interfaces for libgcc_s

Table 11-31 defines the library name and shared object name for the libgcc_s library

Table 11-31 libgcc_s Definition

Library:	libgcc_s
SONAME:	libgcc_s.so.1

The behavior of the interfaces in this library is specified by the following specifications:

[LSB] This Specification

11.8.1 Unwind Library

11.8.1.1 Interfaces for Unwind Library

An LSB conforming implementation shall provide the architecture specific functions for Unwind Library specified in Table 11-32, with the full mandatory functionality as described in the referenced underlying specification.

Table 11-32 libgcc_s - Unwind Library Function Interfaces

_Unwind_Backtrace(GCC_3.3) [LSB]	_Unwind_DeleteException(GCC_3.0) [LSB]	_Unwind_FindEnclosingFunction(GCC_3.3) [LSB]	_Unwind_Find_FDE(GCC_3.0) [LSB]

11.9 Data Definitions for libgcc_s

This section defines global identifiers and their values that are associated with interfaces contained in libgcc_s. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

11.9.1 unwind.h

```

712
713     extern void _Unwind_DeleteException(struct _Unwind_Exception *);
714     extern fde *_Unwind_Find_FDE(void *, struct dwarf_eh_base *);

11.10 Interface Definitions for libgcc_s

The interfaces defined on the following pages are included in libgcc_s and are defined by this specification. Unless otherwise noted, these interfaces shall be included in the source standard.

Other interfaces listed in Section 11.8 shall behave as described in the referenced base document.

_Unwind_DeleteException

Name

`_Unwind_DeleteException` — private C++ error handling method

Synopsis

```
void _Unwind_DeleteException(struct _Unwind_Exception * object);
```

Description

`_Unwind_DeleteException()` deletes the given exception `object`. If a given runtime resumes normal execution after catching a foreign exception, it will not know how to delete that exception. Such an exception shall be deleted by calling `_Unwind_DeleteException()`. This is a convenience function that calls the function pointed to by the `exception_cleanup` field of the exception header.

_Unwind_Find_FDE

Name

`_Unwind_Find_FDE` — private C++ error handling method

Synopsis

```
fde * _Unwind_Find_FDE(void * pc, struct dwarf_eh_bases * bases);
```

Description

`_Unwind_Find_FDE()` looks for the object containing `pc`, then inserts into `bases`.

_Unwind_ForcedUnwind

Name

897 `_Unwind_ForcedUnwind` — private C++ error handling method

Synopsis

898 `_Unwind_Reason_Code _Unwind_ForcedUnwind(struct _Unwind_Exception *`
 899 `object, _Unwind_Stop_Fn stop, void * stop_parameter);`

Description

900 `_Unwind_ForcedUnwind()` raises an exception for forced unwinding, passing along
 901 the given exception `object`, which should have its `exception_class` and
 902 `exception_cleanup` fields set. The exception `object` has been allocated by the
 903 language-specific runtime, and has a language-specific format, except that it shall
 904 contain an `_Unwind_Exception` struct.

905 Forced unwinding is a single-phase process. `stop` and `stop_parameter` control the
 906 termination of the unwind process instead of the usual personality routine query.
 907 `stop` is called for each unwind frame, with the parameteres described for the usual
 908 personality routine below, plus an additional `stop_parameter`.

Return Value

909 When `stop` identifies the destination frame, it transfers control to the user code as
 910 appropriate without returning, normally after calling `_Unwind_DeleteException()`.
 911 If not, then it should return an `_Unwind_Reason_Code` value.

912 If `stop` returns any reason code other than `_URC_NO_REASON`, then the stack state is
 913 indeterminate from the point of view of the caller of `_Unwind_ForcedUnwind()`.
 914 Rather than attempt to return, therefore, the unwind library should use the
 915 `exception_cleanup` entry in the exception, and then call `abort()`.

`_URC_NO_REASON`

917 This is not the destination from. The unwind runtime will call frame's
 918 personality routine with the `_UA_FORCE_UNWIND` and `_UA_CLEANUP_PHASE` flag
 919 set in `actions`, and then unwind to the next frame and call the `stop()` function
 920 again.

`_URC_END_OF_STACK`

922 In order to allow `_Unwind_ForcedUnwind()` to perform special processing
 923 when it reaches the end of the stack, the unwind runtime will call it after the last
 924 frame is rejected, with a `NULL` stack pointer in the context, and the `stop()`
 925 function shall catch this condition. It may return this code if it cannot handle
 926 end-of-stack.

`_URC_FATAL_PHASE2_ERROR`

928 The `stop()` function may return this code for other fatal conditions like stack
 929 corruption.

_Unwind_GetDataRelBase

Name

930 `_Unwind_GetDataRelBase` – private IA64 C++ error handling method

Synopsis

931 `_Unwind_Ptr _Unwind_GetDataRelBase(struct _Unwind_Context * context);`

Description

932 `_Unwind_GetDataRelBase()` returns the global pointer in register one for `context`.

_Unwind_GetGR

Name

933 `_Unwind_GetGR` – private C++ error handling method

Synopsis

934 `_Unwind_Word _Unwind_GetGR(struct _Unwind_Context * context, int index);`

Description

935 `_Unwind_GetGR()` returns data at `index` found in `context`. The register is identified
 936 by its index: 0 to 31 are for the fixed registers, and 32 to 127 are for the stacked
 937 registers.

938 During the two phases of unwinding, only GR1 has a guaranteed value, which is the
 939 global pointer of the frame referenced by the unwind `context`. If the register has its
 940 NAT bit set, the behavior is unspecified.

_Unwind_GetIP

Name

941 `_Unwind_GetIP` – private C++ error handling method

Synopsis

942 `_Unwind_Ptr _Unwind_GetIP(struct _Unwind_Context * context);`

Description

943 `_Unwind_GetIP()` returns the instruction pointer value for the routine identified by
 944 the unwind `context`.

_Unwind_GetLanguageSpecificData

Name

945 `_Unwind_GetLanguageSpecificData` – private C++ error handling method

Synopsis

946 `_Unwind_Ptr _Unwind_GetLanguageSpecificData(struct _Unwind_Context *
947 context, uint value);`

Description

948 `_Unwind_GetLanguageSpecificData()` returns the address of the language specific
949 data area for the current stack frame.

_Unwind_GetRegionStart

Name

950 `_Unwind_GetRegionStart` – private C++ error handling method

Synopsis

951 `_Unwind_Ptr _Unwind_GetRegionStart(struct _Unwind_Context * context);`

Description

952 `_Unwind_GetRegionStart()` routine returns the address (i.e., 0) of the beginning of
953 the procedure or code fragment described by the current unwind descriptor block.

_Unwind_GetTextRelBase

Name

954 `_Unwind_GetTextRelBase` – private IA64 C++ error handling method

Synopsis

955 `_Unwind_Ptr _Unwind_GetTextRelBase(struct _Unwind_Context * context);`

Description

956 `_Unwind_GetTextRelBase()` calls the abort method, then returns.

_Unwind_RaiseException

Name

957 `_Unwind_RaiseException` — private C++ error handling method

Synopsis

958 `_Unwind_Reason_Code _Unwind_RaiseException(struct _Unwind_Exception *
959 object);`

Description

960 `_Unwind_RaiseException()` raises an exception, passing along the given exception
961 `object`, which should have its `exception_class` and `exception_cleanup` fields set.
962 The exception object has been allocated by the language-specific runtime, and has a
963 language-specific format, except that it shall contain an `_Unwind_Exception`.

Return Value

964 `_Unwind_RaiseException()` does not return unless an error condition is found. If
965 an error condition occurs, an `_Unwind_Reason_Code` is returned:

966 `_URC_END_OF_STACK`

967 The unwinder encountered the end of the stack during phase one without
968 finding a handler. The unwind runtime will not have modified the stack. The
969 C++ runtime will normally call `uncaught_exception()` in this case.

970 `_URC_FATAL_PHASE1_ERROR`

971 The unwinder encountered an unexpected error during phase one, because of
972 something like stack corruption. The unwind runtime will not have modified
973 the stack. The C++ runtime will normally call `terminate()` in this case.

974 `_URC_FATAL_PHASE2_ERROR`

975 The unwinder encountered an unexpected error during phase two. This is
976 usually a `throw`, which will call `terminate()`.

_Unwind_Resume

Name

977 `_Unwind_Resume` — private C++ error handling method

Synopsis

978 `void _Unwind_Resume(struct _Unwind_Exception * object);`

Description

979 `_Unwind_Resume()` resumes propagation of an existing exception `object`. A call to
980 this routine is inserted as the end of a landing pad that performs cleanup, but does
981 not resume normal execution. It causes unwinding to proceed further.

_Unwind_SetGR

Name

`_Unwind_SetGR` — private C++ error handling method

Synopsis

```
void _Unwind_SetGR(struct _Unwind_Context * context, int index, uint value);
```

Description

`_Unwind_SetGR()` sets the *value* of the register *indexed* for the routine identified by the unwind *context*.

_Unwind_SetIP

Name

`_Unwind_SetIP` — private C++ error handling method

Synopsis

```
void _Unwind_SetIP(struct _Unwind_Context * context, uint value);
```

Description

`_Unwind_SetIP()` sets the *value* of the instruction pointer for the routine identified by the unwind *context*.

11.11 Interfaces for libdl

Table 11-33 defines the library name and shared object name for the libdl library

Table 11-33 libdl Definition

Library:	libdl
SONAME:	libdl.so.2

The behavior of the interfaces in this library is specified by the following specifications:

[LSB] This Specification

[SUSv3] ISO POSIX (2003)

11.11.1 Dynamic Loader

11.11.1.1 Interfaces for Dynamic Loader

An LSB conforming implementation shall provide the architecture specific functions for Dynamic Loader specified in Table 11-34, with the full mandatory functionality as described in the referenced underlying specification.

Table 11-34 libdl - Dynamic Loader Function Interfaces

<code>dladdr(GLIBC_2.0) [LSB]</code>	<code>dlclose(GLIBC_2.0) [SUSv3]</code>	<code>dlerror(GLIBC_2.0) [SUSv3]</code>	<code>dlopen(GLIBC_2.1) [LSB]</code>
---------------------------------------	--	---	--------------------------------------

1001	dlsym(GLIBC_2.0) [LSB]			
------	-------------------------	--	--	--

11.12 Data Definitions for libdl

This section defines global identifiers and their values that are associated with interfaces contained in libdl. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

This section gives data definitions to promote binary application portability, not to repeat source interface definitions available elsewhere. System providers and application developers should use this ABI to supplement - not to replace - source interface definition specifications.

This specification uses the ISO C (1999) C Language as the reference programming language, and data definitions are specified in ISO C format. The C language is used here as a convenient notation. Using a C language description of these data objects does not preclude their use by other programming languages.

11.12.1 dlfcn.h

```
1016
1017     extern int dladdr(const void *, DL_info *);
1018     extern int dlclose(void *);
1019     extern char *dlerror(void);
1020     extern void *dlopen(char *, int);
1021     extern void *dlsym(void *, char *);
```

11.13 Interfaces for libcrypt

Table 11-35 defines the library name and shared object name for the libcrypt library

Table 11-35 libcrypt Definition

Library:	libcrypt
SONAME:	libcrypt.so.1

The behavior of the interfaces in this library is specified by the following specifications:

[SUSv3] ISO POSIX (2003)

11.13.1 Encryption

11.13.1.1 Interfaces for Encryption

An LSB conforming implementation shall provide the architecture specific functions for Encryption specified in Table 11-36, with the full mandatory functionality as described in the referenced underlying specification.

Table 11-36 libcrypt - Encryption Function Interfaces

crypt(GLIBC_2.0) [SUSv3]	encrypt(GLIBC_2.0) [SUSv3]	setkey(GLIBC_2.0) [SUSv3]	
-----------------------------	-------------------------------	------------------------------	--

IV Utility Libraries

12 Libraries

1 An LSB-conforming implementation shall also support some utility libraries which
2 are built on top of the interfaces provided by the base libraries. These libraries
3 implement common functionality, and hide additional system dependent
4 information such as file formats and device names.

12.1 Interfaces for libz

5 Table 12-1 defines the library name and shared object name for the libz library

6 **Table 12-1 libz Definition**

Library:	libz
SONAME:	libz.so.1

12.1.1 Compression Library

12.1.1.1 Interfaces for Compression Library

9 No external functions are defined for libz - Compression Library in this part of the
10 specification. See also the generic specification.

12.2 Data Definitions for libz

11 This section defines global identifiers and their values that are associated with
12 interfaces contained in libz. These definitions are organized into groups that
13 correspond to system headers. This convention is used as a convenience for the
14 reader, and does not imply the existence of these headers, or their content. Where an
15 interface is defined as requiring a particular system header file all of the data
16 definitions for that system header file presented here shall be in effect.

17 This section gives data definitions to promote binary application portability, not to
18 repeat source interface definitions available elsewhere. System providers and
19 application developers should use this ABI to supplement - not to replace - source
20 interface definition specifications.

21 This specification uses the ISO C (1999) C Language as the reference programming
22 language, and data definitions are specified in ISO C . The C language is used here
23 as a convenient notation. Using a C language description of these data objects does
24 not preclude their use by other programming languages.

12.2.1 zlib.h

```
25
26     extern int gzread(gzFile, voidp, unsigned int);
27     extern int gzclose(gzFile);
28     extern gzFile gzopen(const char *, const char *);
29     extern gzFile gzdopen(int, const char *);
30     extern int gzwrite(gzFile, voidpc, unsigned int);
31     extern int gzflush(gzFile, int);
32     extern const char *gzerror(gzFile, int *);
33     extern uLong adler32(uLong, const Bytef *, uInt);
34     extern int compress(Bytef *, uLongf *, const Bytef *, uLong);

36     extern uLong crc32(uLong, const Bytef *, uInt);
37     extern int deflate(z_streamp, int);
```

```

38     extern int deflateCopy(z_streamp, z_streamp);
39     extern int deflateEnd(z_streamp);
40     extern int deflateInit2_(z_streamp, int, int, int, int, int, const char
41     *,
42             int);
43     extern int deflateInit_(z_streamp, int, const char *, int);
44     extern int deflateParams(z_streamp, int, int);
45     extern int deflateReset(z_streamp);
46     extern int deflateSetDictionary(z_streamp, const Bytef *, uInt);
47     extern const uLongf *get_crc_table(void);
48     extern int gzeof(gzFile);
49     extern int gzgetc(gzFile);
50     extern char *gzgets(gzFile, char *, int);
51     extern int gzprintf(gzFile, const char *, ...);
52     extern int gzputc(gzFile, int);
53     extern int gzputs(gzFile, const char *);
54     extern int gzrewind(gzFile);
55     extern z_off_t gzseek(gzFile, z_off_t, int);
56     extern int gzsetparams(gzFile, int, int);
57     extern z_off_t gtell(gzFile);
58     extern int inflate(z_streamp, int);
59     extern int inflateEnd(z_streamp);
60     extern int inflateInit2_(z_streamp, int, const char *, int);
61     extern int inflateInit_(z_streamp, const char *, int);
62     extern int inflateReset(z_streamp);
63     extern int inflateSetDictionary(z_streamp, const Bytef *, uInt);
64     extern int inflateSync(z_streamp);
65     extern int inflateSyncPoint(z_streamp);
66     extern int uncompress(Bytef *, uLongf *, const Bytef *, uLong);
67     extern const char *zError(int);
68     extern const char *zlibVersion(void);
69     extern uLong deflateBound(z_streamp, uLong);
70     extern uLong compressBound(uLong);

```

12.3 Interfaces for libncurses

Table 12-2 defines the library name and shared object name for the libncurses library

Table 12-2 libncurses Definition

Library:	libncurses
SONAME:	libncurses.so.5

12.3.1 Curses

12.3.1.1 Interfaces for Curses

No external functions are defined for libncurses - Curses in this part of the specification. See also the generic specification.

12.4 Data Definitions for libncurses

This section defines global identifiers and their values that are associated with interfaces contained in libncurses. These definitions are organized into groups that correspond to system headers. This convention is used as a convenience for the reader, and does not imply the existence of these headers, or their content. Where an interface is defined as requiring a particular system header file all of the data definitions for that system header file presented here shall be in effect.

83 This section gives data definitions to promote binary application portability, not to
 84 repeat source interface definitions available elsewhere. System providers and
 85 application developers should use this ABI to supplement - not to replace - source
 86 interface definition specifications.

87 This specification uses the ISO C (1999) C Language as the reference programming
 88 language, and data definitions are specified in ISO C . The C language is used here
 89 as a convenient notation. Using a C language description of these data objects does
 90 not preclude their use by other programming languages.

393                      );

```

395 extern TERMINAL *cur_term(void);

12.5 Interfaces for libutil

396 Table 12-3 defines the library name and shared object name for the libutil library

397 **Table 12-3 libutil Definition**

Library:	libutil
SONAME:	libutil.so.1

398 The behavior of the interfaces in this library is specified by the following specifications:

401 [LSB] This Specification

12.5.1 Utility Functions

12.5.1.1 Interfaces for Utility Functions

402 An LSB conforming implementation shall provide the architecture specific functions
 403 404 for Utility Functions specified in Table 12-4, with the full mandatory functionality as
 405 described in the referenced underlying specification.

406 **Table 12-4 libutil - Utility Functions Function Interfaces**

forkpty(GLIBC_2.0) [LSB]	login(GLIBC_2.0) [LSB]	login_tty(GLIBC_2.0) [LSB]	logout(GLIBC_2.0) [LSB]
logwtmp(GLIBC_2.0) [LSB]	openpty(GLIBC_2.0) [LSB]		

V Package Format and Installation

13 Software Installation

13.1 Package Dependencies

1 The LSB runtime environment shall provide the following dependencies.

2 lsb-core-ppc32

3 This dependency is used to indicate that the application is dependent on
4 features contained in the LSB-Core specification.

5 These dependencies shall have a version of 3.0.

6 Other LSB modules may add additional dependencies; such dependencies shall
7 have the format `lsb-module-ppc32`.

13.2 Package Architecture Considerations

8 All packages must specify an architecture of `ppc`. A LSB runtime environment must
9 accept an architecture of `ppc` even if the native architecture is different.

10 The `archnum` value in the Lead Section shall be `0x0005`.

Annex B GNU Free Documentation License (Informative)

This specification is published under the terms of the GNU Free Documentation License

1 , Version 1.1, March 2000

2 Copyright (C) 2000 Free Software Foundation, Inc. 59 Temple Place, Suite 330, Boston,
3 MA 02111-1307 USA Everyone is permitted to copy and distribute verbatim copies of
4 this license document, but changing it is not allowed.

AB.1. PREAMBLE

5 The purpose of this License is to make a manual, textbook, or other written
6 document "free" in the sense of freedom: to assure everyone the effective freedom to
7 copy and redistribute it, with or without modifying it, either commercially or
8 noncommercially. Secondarily, this License preserves for the author and publisher a
9 way to get credit for their work, while not being considered responsible for
10 modifications made by others.

11 This License is a kind of "copyleft", which means that derivative works of the
12 document must themselves be free in the same sense. It complements the GNU
13 General Public License, which is a copyleft license designed for free software.

14 We have designed this License in order to use it for manuals for free software,
15 because free software needs free documentation: a free program should come with
16 manuals providing the same freedoms that the software does. But this License is not
17 limited to software manuals; it can be used for any textual work, regardless of
18 subject matter or whether it is published as a printed book. We recommend this
19 License principally for works whose purpose is instruction or reference.

AB.2. APPLICABILITY AND DEFINITIONS

20 This License applies to any manual or other work that contains a notice placed by
21 the copyright holder saying it can be distributed under the terms of this License. The
22 "Document", below, refers to any such manual or work. Any member of the public is
23 a licensee, and is addressed as "you".

24 A "Modified Version" of the Document means any work containing the Document or
25 a portion of it, either copied verbatim, or with modifications and/or translated into
26 another language.

27 A "Secondary Section" is a named appendix or a front-matter section of the
28 Document that deals exclusively with the relationship of the publishers or authors of
29 the Document to the Document's overall subject (or to related matters) and contains
30 nothing that could fall directly within that overall subject. (For example, if the
31 Document is in part a textbook of mathematics, a Secondary Section may not explain
32 any mathematics.) The relationship could be a matter of historical connection with
33 the subject or with related matters, or of legal, commercial, philosophical, ethical or
34 political position regarding them.

35 The "Invariant Sections" are certain Secondary Sections whose titles are designated,
36 as being those of Invariant Sections, in the notice that says that the Document is
37 released under this License.

38 The "Cover Texts" are certain short passages of text that are listed, as Front-Cover
39 Texts or Back-Cover Texts, in the notice that says that the Document is released
40 under this License.

41 A "Transparent" copy of the Document means a machine-readable copy, represented
42 in a format whose specification is available to the general public, whose contents can
43 be viewed and edited directly and straightforwardly with generic text editors or (for
44 images composed of pixels) generic paint programs or (for drawings) some widely
45 available drawing editor, and that is suitable for input to text formatters or for
46 automatic translation to a variety of formats suitable for input to text formatters. A
47 copy made in an otherwise Transparent file format whose markup has been
48 designed to thwart or discourage subsequent modification by readers is not
49 Transparent. A copy that is not "Transparent" is called "Opaque".

50 Examples of suitable formats for Transparent copies include plain ASCII without
51 markup, Texinfo input format, LaTeX input format, SGML or XML using a publicly
52 available DTD, and standard-conforming simple HTML designed for human
53 modification. Opaque formats include PostScript, PDF, proprietary formats that can
54 be read and edited only by proprietary word processors, SGML or XML for which
55 the DTD and/or processing tools are not generally available, and the
56 machine-generated HTML produced by some word processors for output purposes
57 only.

58 The "Title Page" means, for a printed book, the title page itself, plus such following
59 pages as are needed to hold, legibly, the material this License requires to appear in
60 the title page. For works in formats which do not have any title page as such, "Title
61 Page" means the text near the most prominent appearance of the work's title,
62 preceding the beginning of the body of the text.

AB.3. VERBATIM COPYING

63 You may copy and distribute the Document in any medium, either commercially or
64 noncommercially, provided that this License, the copyright notices, and the license
65 notice saying this License applies to the Document are reproduced in all copies, and
66 that you add no other conditions whatsoever to those of this License. You may not
67 use technical measures to obstruct or control the reading or further copying of the
68 copies you make or distribute. However, you may accept compensation in exchange
69 for copies. If you distribute a large enough number of copies you must also follow
70 the conditions in section 3.

71 You may also lend copies, under the same conditions stated above, and you may
72 publicly display copies.

AB.4. COPYING IN QUANTITY

73 If you publish printed copies of the Document numbering more than 100, and the
74 Document's license notice requires Cover Texts, you must enclose the copies in
75 covers that carry, clearly and legibly, all these Cover Texts: Front-Cover Texts on the
76 front cover, and Back-Cover Texts on the back cover. Both covers must also clearly
77 and legibly identify you as the publisher of these copies. The front cover must
78 present the full title with all words of the title equally prominent and visible. You
79 may add other material on the covers in addition. Copying with changes limited to
80 the covers, as long as they preserve the title of the Document and satisfy these
81 conditions, can be treated as verbatim copying in other respects.

82 If the required texts for either cover are too voluminous to fit legibly, you should put
83 the first ones listed (as many as fit reasonably) on the actual cover, and continue the
84 rest onto adjacent pages.

85 If you publish or distribute Opaque copies of the Document numbering more than
86 100, you must either include a machine-readable Transparent copy along with each
87 Opaque copy, or state in or with each Opaque copy a publicly-accessible
88 computer-network location containing a complete Transparent copy of the
89 Document, free of added material, which the general network-using public has
90 access to download anonymously at no charge using public-standard network
91 protocols. If you use the latter option, you must take reasonably prudent steps, when
92 you begin distribution of Opaque copies in quantity, to ensure that this Transparent
93 copy will remain thus accessible at the stated location until at least one year after the
94 last time you distribute an Opaque copy (directly or through your agents or
95 retailers) of that edition to the public.

96 It is requested, but not required, that you contact the authors of the Document well
97 before redistributing any large number of copies, to give them a chance to provide
98 you with an updated version of the Document.

AB.5. MODIFICATIONS

99 You may copy and distribute a Modified Version of the Document under the
100 conditions of sections 2 and 3 above, provided that you release the Modified Version
101 under precisely this License, with the Modified Version filling the role of the
102 Document, thus licensing distribution and modification of the Modified Version to
103 whoever possesses a copy of it. In addition, you must do these things in the
104 Modified Version:

- 105 A. Use in the Title Page (and on the covers, if any) a title distinct from that of the
106 Document, and from those of previous versions (which should, if there were
107 any, be listed in the History section of the Document). You may use the same
108 title as a previous version if the original publisher of that version gives
109 permission.
- 110 B. List on the Title Page, as authors, one or more persons or entities responsible
111 for authorship of the modifications in the Modified Version, together with at
112 least five of the principal authors of the Document (all of its principal authors,
113 if it has less than five).
- 114 C. State on the Title page the name of the publisher of the Modified Version, as
115 the publisher.
- 116 D. Preserve all the copyright notices of the Document.
- 117 E. Add an appropriate copyright notice for your modifications adjacent to the
118 other copyright notices.
- 119 F. Include, immediately after the copyright notices, a license notice giving the
120 public permission to use the Modified Version under the terms of this License,
121 in the form shown in the Addendum below.
- 122 G. Preserve in that license notice the full lists of Invariant Sections and required
123 Cover Texts given in the Document's license notice.
- 124 H. Include an unaltered copy of this License.
- 125 I. Preserve the section entitled "History", and its title, and add to it an item
126 stating at least the title, year, new authors, and publisher of the Modified

127 Version as given on the Title Page. If there is no section entitled "History" in
128 the Document, create one stating the title, year, authors, and publisher of the
129 Document as given on its Title Page, then add an item describing the Modified
130 Version as stated in the previous sentence.

131 J. Preserve the network location, if any, given in the Document for public access
132 to a Transparent copy of the Document, and likewise the network locations
133 given in the Document for previous versions it was based on. These may be
134 placed in the "History" section. You may omit a network location for a work
135 that was published at least four years before the Document itself, or if the
136 original publisher of the version it refers to gives permission.

137 K. In any section entitled "Acknowledgements" or "Dedications", preserve the
138 section's title, and preserve in the section all the substance and tone of each of
139 the contributor acknowledgements and/or dedications given therein.

140 L. Preserve all the Invariant Sections of the Document, unaltered in their text and
141 in their titles. Section numbers or the equivalent are not considered part of the
142 section titles.

143 M. Delete any section entitled "Endorsements". Such a section may not be
144 included in the Modified Version.

145 N. Do not retitle any existing section as "Endorsements" or to conflict in title with
146 any Invariant Section.

147 If the Modified Version includes new front-matter sections or appendices that
148 qualify as Secondary Sections and contain no material copied from the Document,
149 you may at your option designate some or all of these sections as invariant. To do
150 this, add their titles to the list of Invariant Sections in the Modified Version's license
151 notice. These titles must be distinct from any other section titles.

152 You may add a section entitled "Endorsements", provided it contains nothing but
153 endorsements of your Modified Version by various parties—for example, statements
154 of peer review or that the text has been approved by an organization as the
155 authoritative definition of a standard.

156 You may add a passage of up to five words as a Front-Cover Text, and a passage of
157 up to 25 words as a Back-Cover Text, to the end of the list of Cover Texts in the
158 Modified Version. Only one passage of Front-Cover Text and one of Back-Cover
159 Text may be added by (or through arrangements made by) any one entity. If the
160 Document already includes a cover text for the same cover, previously added by you
161 or by arrangement made by the same entity you are acting on behalf of, you may not
162 add another; but you may replace the old one, on explicit permission from the
163 previous publisher that added the old one.

164 The author(s) and publisher(s) of the Document do not by this License give
165 permission to use their names for publicity for or to assert or imply endorsement of
166 any Modified Version.

AB.6. COMBINING DOCUMENTS

167 You may combine the Document with other documents released under this License,
168 under the terms defined in section 4 above for modified versions, provided that you
169 include in the combination all of the Invariant Sections of all of the original
170 documents, unmodified, and list them all as Invariant Sections of your combined
171 work in its license notice.

172 The combined work need only contain one copy of this License, and multiple
173 identical Invariant Sections may be replaced with a single copy. If there are multiple
174 Invariant Sections with the same name but different contents, make the title of each
175 such section unique by adding at the end of it, in parentheses, the name of the
176 original author or publisher of that section if known, or else a unique number. Make
177 the same adjustment to the section titles in the list of Invariant Sections in the license
178 notice of the combined work.

179 In the combination, you must combine any sections entitled "History" in the various
180 original documents, forming one section entitled "History"; likewise combine any
181 sections entitled "Acknowledgements", and any sections entitled "Dedications". You
182 must delete all sections entitled "Endorsements."

AB.7. COLLECTIONS OF DOCUMENTS

183 You may make a collection consisting of the Document and other documents
184 released under this License, and replace the individual copies of this License in the
185 various documents with a single copy that is included in the collection, provided
186 that you follow the rules of this License for verbatim copying of each of the
187 documents in all other respects.

188 You may extract a single document from such a collection, and distribute it
189 individually under this License, provided you insert a copy of this License into the
190 extracted document, and follow this License in all other respects regarding verbatim
191 copying of that document.

AB.8. AGGREGATION WITH INDEPENDENT WORKS

192 A compilation of the Document or its derivatives with other separate and
193 independent documents or works, in or on a volume of a storage or distribution
194 medium, does not as a whole count as a Modified Version of the Document,
195 provided no compilation copyright is claimed for the compilation. Such a
196 compilation is called an "aggregate", and this License does not apply to the other
197 self-contained works thus compiled with the Document, on account of their being
198 thus compiled, if they are not themselves derivative works of the Document.

199 If the Cover Text requirement of section 3 is applicable to these copies of the
200 Document, then if the Document is less than one quarter of the entire aggregate, the
201 Document's Cover Texts may be placed on covers that surround only the Document
202 within the aggregate. Otherwise they must appear on covers around the whole
203 aggregate.

AB.9. TRANSLATION

204 Translation is considered a kind of modification, so you may distribute translations
205 of the Document under the terms of section 4. Replacing Invariant Sections with
206 translations requires special permission from their copyright holders, but you may
207 include translations of some or all Invariant Sections in addition to the original
208 versions of these Invariant Sections. You may include a translation of this License
209 provided that you also include the original English version of this License. In case of
210 a disagreement between the translation and the original English version of this
211 License, the original English version will prevail.

AB.10. TERMINATION

212 You may not copy, modify, sublicense, or distribute the Document except as
213 expressly provided for under this License. Any other attempt to copy, modify,
214 sublicense or distribute the Document is void, and will automatically terminate your
215 rights under this License. However, parties who have received copies, or rights,
216 from you under this License will not have their licenses terminated so long as such
217 parties remain in full compliance.

AB.11. FUTURE REVISIONS OF THIS LICENSE

218 The Free Software Foundation may publish new, revised versions of the GNU Free
219 Documentation License from time to time. Such new versions will be similar in spirit
220 to the present version, but may differ in detail to address new problems or concerns.
221 See <http://www.gnu.org/copyleft/>.

222 Each version of the License is given a distinguishing version number. If the
223 Document specifies that a particular numbered version of this License "or any later
224 version" applies to it, you have the option of following the terms and conditions
225 either of that specified version or of any later version that has been published (not as
226 a draft) by the Free Software Foundation. If the Document does not specify a version
227 number of this License, you may choose any version ever published (not as a draft)
228 by the Free Software Foundation.

AB.12. How to use this License for your documents

229 To use this License in a document you have written, include a copy of the License in
230 the document and put the following copyright and license notices just after the title
231 page:

232 Copyright (c) YEAR YOUR NAME. Permission is granted to copy, distribute and/or
233 modify this document under the terms of the GNU Free Documentation License, Version
234 1.1 or any later version published by the Free Software Foundation; with the Invariant
235 Sections being LIST THEIR TITLES, with the Front-Cover Texts being LIST, and with the
236 Back-Cover Texts being LIST. A copy of the license is included in the section entitled
237 "GNU Free Documentation License".

238 If you have no Invariant Sections, write "with no Invariant Sections" instead of
239 saying which ones are invariant. If you have no Front-Cover Texts, write "no
240 Front-Cover Texts" instead of "Front-Cover Texts being LIST"; likewise for
241 Back-Cover Texts.

242 If your document contains nontrivial examples of program code, we recommend
243 releasing these examples in parallel under your choice of free software license, such
244 as the GNU General Public License, to permit their use in free software.
